TAMURA KAZUTOSHI(54) SPHERICAL CALCITE-TYPE CALCIUM  
CARBONATE, ITS PREPARATION, AND  
ABRASIVE FOR TOOTHPASTE

## (57) Abstract:

PURPOSE: To prepare the titled calcium carbonate having mild abrasive action to the tooth, capable of improving the gloss of the tooth, and giving an abrasive for tooth paste having stable quality for a long period, by the heat-treatment of spherical vaterite-type calcium carbonate.

CONSTITUTION: Spherical vaterite-type calcium car-

bonate is converted to spherical calcite-type calcium carbonate at a conversion of almost 100%, by the heat treatment at 400W/800°C for 0.5W/24hr under 1W/10 atm. in air or in an inert gas atmosphere. The spherical calcite-type calcium carbonate keeps its spherical shape stably for a long period even in the presence of water. When it is used as an abrasive for toothpaste, it exhibits mild abrasive action to the tooth, polishes the surface of the tooth excellently to improve the gloss of the tooth, improves the dispersibility of the toothpaste in the mouth, and gives improved feeling to the mouth.
